Chapter 1

Class Index

1.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

DynamicArray< T >	3
---	-------------------

Chapter 2

Class Documentation

2.1 `DynamicArray< T >` Class Template Reference

Public Member Functions

- `DynamicArray ()`
Default Constructor.
- `DynamicArray (int size)`
Constructor with an initial size.
- `DynamicArray (int size, T initialData)`
Constructor with and initial size and initializing value.
- `~DynamicArray ()`
Destructor.
- `T pop ()`
This will remove the last element and will return it.
- `T & back ()`
This function will return the last element of the `DynamicArray` and can be also used to set the last element.
- `T & front ()`
This function will return the first element of the `DynamicArray` and can be also used to set the first element.
- `T & at (int index)`
This function will return the element stored at given index and can be also used to set the value at given index.
- `T & operator[] (int index)`
This is another way to access and modify the value at given index. This is same as `at()` function.
- `T removeAt (int index)`
This function will remove the element stored at the given index.
- `void push_back (T key)`
This function will add an element at last of the `DynamicArray`.
- `void insertAt (int index, T key)`
This function will insert a value at given index.
- `int size ()`
This function will return the size of the `DynamicArray`.
- `int indexOf (T key)`
This function will return the index of an element in the `DynamicArray`, if found otherwise it will return -1.
- `bool is_empty ()`
This function will return true if `DynamicArray` is empty else false.
- `bool remove (T key)`
This function will remove an element from the `DynamicArray` if found and will return true else false.
- `bool contains (T key)`
This will check whether given element is present in the Dynamic Array and will return true and false accordingly.

2.1.1 Constructor & Destructor Documentation

2.1.1.1 `DynamicArray()` [1/2]

```
template<class T >
DynamicArray< T >::DynamicArray (
    int size )
```

Constructor with an initial size.

Parameters

<i>size</i>	The initial size of the dynamic array
-------------	---------------------------------------

2.1.1.2 `DynamicArray()` [2/2]

```
template<class T >
DynamicArray< T >::DynamicArray (
    int size,
    T initialData )
```

Constructor with and initial size and initializing value.

Parameters

<i>size</i>	The initial size of the dynamic array
<i>initialData</i>	Initial value to initialize the array with.

2.1.2 Member Function Documentation

2.1.2.1 `at()`

```
template<class T >
T & DynamicArray< T >::at (
    int index )
```

This function will return the element stored at given index and can be also used to set the value at given index.

Parameters

<i>index</i>	Index where we need to access the element.
--------------	--

2.1.2.2 `contains()`

```
template<class T >
bool DynamicArray< T >::contains (
    T key )
```

This will check whether given element is present in the Dynamic Array and will return true and false accordingly.

Parameters

<i>key</i>	Element which has to be check whether it is present in the dynamicArray or not.
------------	---

2.1.2.3 `indexOf()`

```
template<class T >
int DynamicArray< T >::indexOf (
    T key )
```

This function will return the index of an element in the `DynamicArray`, if found otherwise it will return -1.

Parameters

<i>key</i>	Element whose index has to be find
------------	------------------------------------

2.1.2.4 `insertAt()`

```
template<class T >
void DynamicArray< T >::insertAt (
    int index,
    T key )
```

This function will insert a value at given index.

Parameters

<i>index</i>	Index where we need to insert the element
<i>key</i>	Value which has to be inserted

2.1.2.5 operator[]()

```
template<class T >
T & DynamicArray< T >::operator[] (
    int index )
```

This is another way to access and modify the value at given index. This is same as [at\(\)](#) function.

Parameters

<i>index</i>	Index where we need to access the element.
--------------	--

2.1.2.6 push_back()

```
template<class T >
void DynamicArray< T >::push_back (
    T key )
```

This function will add an element at last of the [DynamicArray](#).

Parameters

<i>key</i>	The value which has to be added at the last of the DynamicArray .
------------	---

2.1.2.7 remove()

```
template<class T >
bool DynamicArray< T >::remove (
    T key )
```

This function will remove an element from the [DynamicArray](#) if found and will return true else false.

Parameters

<i>key</i>	Element which has to be removed
------------	---------------------------------

2.1.2.8 removeAt()

```
template<class T >
T DynamicArray< T >::removeAt (
    int index )
```

This function will remove the element stored at the given index.

Parameters

<i>index</i>	From where we need to remove the element
--------------	--

The documentation for this class was generated from the following files:

- include/dynamicArray.h
- src/dynamicArray.cpp
